Outline

Generative Models for Discrete Data

Likelihood Adding a Prior Posterior Posterior Predictive Distribution

Steps for Learning a Generative Model

Incorporating Prior Beta Distribution Conjugate Priors Estimating Posterior Using Predictive Distribution Need for Prior Need for Bayesian Averaging

Learning Gaussian Models

Estimating Parameters Estimating Posterior

▶ Let X represents the data with multiple discrete attributes

Y represent the class

Most probable class

$$P(Y = c | \mathbf{X} = \mathbf{x}, \boldsymbol{\theta}) \propto P(\mathbf{X} = \mathbf{x} | Y = c, \boldsymbol{\theta}) P(Y = c, \boldsymbol{\theta})$$

$$P(\mathbf{X} = \mathbf{x} | Y = c, \theta) = p(\mathbf{x} | y = c, \theta)$$

- ▶ $p(\mathbf{x}|y = c, \theta)$ class conditional density
- How is the data distributed for each class?

Concept Learning in Number Line

- I give you a set of numbers (training set D) belonging to a concept
- Choose the most likely hypothesis (concept)
- Assume that numbers are between 1 and 100
- ► Hypothesis Space (*H*):
 - All powers of 2
 - All powers of 4
 - All even numbers
 - All prime numbers
 - Numbers close to a fixed number (say 12)

Hypothesis Space (\mathcal{H})

- 1. Even numbers
- 2. Odd numbers
- 3. Squares
- 4. Powers of 2
- 5. Powers of 4

Hypothesis Space (\mathcal{H})

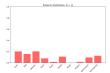

- 6. Powers of 16
- 7. Multiples of 5
- 8. Multiples of 10
- 9. Numbers within 20 \pm 5
- 10. All numbers between 1 and 100

Ready?

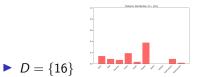

Hypothesis Space (\mathcal{H})

- 1. Even numbers
- 2. Odd numbers
- 3. Squares
- 4. Powers of 2
- 5. Powers of 4
- 6. Powers of 16
- 7. Multiples of 5
- 8. Multiples of 10
- 9. Numbers within 20 ± 5
- 10. All numbers between 1 and 100

Hypothesis Space (\mathcal{H})

- 1. Even numbers
- 2. Odd numbers
- 3. Squares
- 4. Powers of 2
- 5. Powers of 4
- 6. Powers of 16
- 7. Multiples of 5
- 8. Multiples of 10
- 9. Numbers within 20 ± 5
- 10. All numbers between 1 and 100

$D = \{1, 4, 16, 64\}$

Adding a Prior

- Inside information about the hypotheses
- Some hypotheses are more likely apriori
 - May not be the right hypothesis (prior can be wrong)

Posterior

- ▶ Revised estimates for h after observing evidence (D) and the prior
- Posterior \propto Likelihood \times Prior

$$p(h|D) = \frac{p(D|h)p(h)}{\sum_{h' \in \mathcal{H}} p(D|h')p(h')}$$

	h	Prior	Likelihood	Posterior
1	Even	0.300	1.600e-07	1.403e-04
2	Odd	0.075	0.000e+00	0.000e+00

Finding the Best Hypothesis

Maximum A Priori Estimate

$$\hat{h}_{prior} = rgmax_{h} p(h)$$

Maximum Likelihood Estimate (MLE)

$$\hat{h}_{MLE} = \arg \max_{h} p(D|h) = \arg \max_{h} \log p(D|h)$$
$$= \arg \max_{h} \sum_{x \in D} \log p(x|H)$$

Maximum a Posteriori (MAP) Estimate

$$\hat{h}_{MAP} = rg\max_{h} p(D|h)p(h) = rg\max_{h} (\log p(D|h) + \log p(h))$$

Chandola@UB

$$\hat{h}_{prior} - \text{Most likely hypothesis based on prior}$$

$$\hat{h}_{MLE} - \text{Most likely hypothesis based on evidence}$$

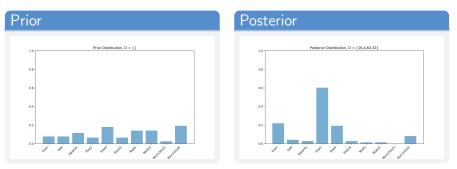

$$\hat{h}_{MAP} - \text{Most likely hypothesis based on posterior}$$

$$\hat{h}_{prior} = \arg\max_{h} \log p(h)$$

$$\hat{h}_{MLE} = \arg\max_{h} \log p(D|h)$$

$$\hat{h}_{MAP} = \arg\max_{h} (\log p(D|h) + \log p(h))$$

- As data increases, MAP estimate converges towards MLE
 Why?
- MAP/MLE are consistent estimators
 - ▶ If concept is in *H*, MAP/ML estimates will converge
- ▶ If $c \notin H$, MAP/ML estimates converge to *h* which is closest possible to the truth

Objective: To revise the prior distribution over the hypotheses after observing data (evidence).

Posterior Predictive Distribution

- ▶ New input, *x**
- What is the probability that x* is also generated by the same concept as D?

•
$$P(Y = c | X = x^*, D)?$$

Option 0: Treat *h*^{prior} as the true concept

$$P(Y = c | X = x^*, D) = P(X = x^* | c = h^{prior})$$

Option 1: Treat h^{MLE} as the true concept

$$P(Y = c | X = x^*, D) = P(X = x^* | c = h^{MLE})$$

Option 2: Treat h^{MAP} as the true concept

$$P(Y = c | X = x^*, D) = P(X = x^* | c = h^{MAP})$$

Option 3: Bayesian Averaging

$$P(Y = c | X = x^*, D) = \sum_{h} P(X = x^* | c = h) p(h | D)$$

Chandola@UB

CSE 474/574 16 / 31

Steps for Learning a Generative Model

- Example: D is a sequence of N binary values (0s and 1s) (coin tosses)
- ▶ What is the best distribution that could describe *D*?
- What is the probability of observing a *head* in future?

Step 1: Choose the form of the model

- Hypothesis Space All possible distributions
 - Too complicated!!
- Revised hypothesis space All Bernoulli distributions (X ~ Ber(θ), 0 ≤ θ ≤ 1)
 - θ is the hypothesis
 - Still infinite (θ can take infinite possible values)

Compute Likelihood

• Likelihood of
$$D$$

$$p(D|\theta) = \theta^{N_1} (1-\theta)^{N_0}$$

Maximum Likelihood Estimate

$$\begin{split} \hat{\theta}_{MLE} &= \arg \max_{\theta} p(D|\theta) = \arg \max_{\theta} \theta^{N_1} (1-\theta)^{N_0} \\ &= \frac{N_1}{N_0 + N_1} \end{split}$$

< □ >	<⊡> < ≣>	- < ≣ >	1	10
CSE 474/574	18 / 31			

Compute Likelihood

• Likelihood of
$$D$$

$$p(D|\theta) = \theta^{N_1} (1-\theta)^{N_0}$$

Maximum Likelihood Estimate

$$\begin{split} \hat{\theta}_{MLE} &= \arg \max_{\theta} p(D|\theta) = \arg \max_{\theta} \theta^{N_1} (1-\theta)^{N_0} \\ &= \frac{N_1}{N_0 + N_1} \end{split}$$

• We can stop here (MLE approach)

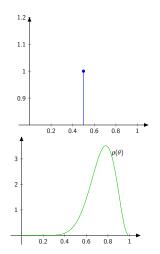

Probability of getting a head next:

$$p(x^* = 1|D) = \hat{\theta}_{MLE}$$

Chandola@UB

Incorporating Prior

- Prior *encodes* our prior belief on *θ*
- How to set a Bayesian prior?
 - 1. A point estimate: $\theta_{prior} = 0.5$
 - 2. A probability distribution over θ (a random variable)
 - Which one?
 - For a bernoulli distribution $0 \le \theta \le 1$
 - Beta Distribution

Beta Distribution as Prior

Continuous random variables defined between 0 and 1

$$Beta(heta|a,b) riangleq p(heta|a,b) = rac{1}{B(a,b)} heta^{a-1} (1- heta)^{b-1}$$

a and *b* are the (hyper-)parameters for the distribution *B*(*a*, *b*) is the **beta function**

$$B(a,b) = rac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}$$
 $\Gamma(x) = \int_0^\infty u^{x-1}e^{-u}du$

If x is integer

$$\Gamma(x) = (x-1)!$$

- "Control" the shape of the pdf
- We can stop here as well (prior approach)

$$p(x^* = 1) = \theta_{prior}$$

Chandola@UB

CSE 474/574 20 / 31

Another reason to choose Beta distribution

$$egin{aligned} &
ho(D| heta) = heta^{N_1}(1- heta)^{N_0} \ &
ho(heta) \propto heta^{\mathfrak{s}-1}(1- heta)^{b-1} \end{aligned}$$

Posterior \propto Likelihood \times Prior

$$egin{aligned} & p(heta|D) & \propto & heta^{N_1}(1- heta)^{N_0} heta^{a-1}(1- heta)^{b-1} \ & \propto & heta^{N_1+a-1}(1- heta)^{N_0+b-1} \end{aligned}$$

Posterior has same form as the prior

Beta distribution is a conjugate prior for Bernoulli/Binomial distribution

Posterior

$$p(\theta|D) \propto \theta^{N_1+a-1}(1-\theta)^{N_0+b-1}$$

= $Beta(\theta|N_1+a, N_0+b)$

We start with a belief that

$$\mathbb{E}[\theta] = \frac{a}{a+b}$$

After observing N trials in which we observe N₁ heads and N₀ trails, we update our belief as:

$$\mathbb{E}[\theta|D] = \frac{\mathsf{a} + \mathsf{N}_1}{\mathsf{a} + \mathsf{b} + \mathsf{N}}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < ○ < ○
 CSE 474/574 22 / 31

We know that posterior over θ is a beta distribution MAP estimate

$$\hat{ heta}_{MAP} = rgmax_{ heta} p(heta|a + N_1, b + N_0) \ = rac{a + N_1 - 1}{a + b + N - 2}$$

- What happens if a = b = 1?
- We can stop here as well (MAP approach)

Probability of getting a head next:

$$p(x^* = 1|D) = \hat{\theta}_{MAP}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < ○ < ○
 CSE 474/574 23 / 31

• All values of θ are possible

Prediction on an unknown input (x^*) is given by *Bayesian Averaging*

$$p(x^* = 1|D) = \int_0^1 p(x = 1|\theta)p(\theta|D)d\theta$$
$$= \int_0^1 \theta Beta(\theta|a + N_1, b + N_0)$$
$$= \mathbb{E}[\theta|D]$$
$$= \frac{a + N_1}{a + b + N}$$

• This is same as using $\mathbb{E}[\theta|D]$ as a point estimate for θ

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < ○ < ○
 CSE 474/574 24 / 31

- ► Why use a prior?
- Consider D =tails, tails, tails
- ▶ $N_1 = 0, N = 3$
- $\blacktriangleright \hat{\theta}_{MLE} = 0$

▶
$$p(x^* = 1|D) = 0!!$$

- Never observe a heads
- The black swan paradox
- How does the Bayesian approach help?

$$p(x^*=1|D)=\frac{a}{a+b+3}$$

< □ >	 	/ 《 문 🕨	ヨー つく
CSE 474/574	25 / 31		

MAP is only one part of the posterior

- θ at which the posterior probability is maximum
- But is that enough?
- What about the posterior variance of θ?

$$var[heta|D] = rac{(a+N_1)(b+N_0)}{(a+b+N)^2(a+b+N+1)}$$

- If variance is high then θ_{MAP} is not trustworthy
- Bayesian averaging helps in this case

pdf for MVN with d dimensions:

$$\mathcal{N}(\mathbf{x}|\boldsymbol{\mu}, \boldsymbol{\Sigma}) \triangleq rac{1}{(2\pi)^{d/2} |\boldsymbol{\Sigma}|^{1/2}} exp\left[-rac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^{\top} \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu})
ight]$$

CSE 474/574	27 / 31		

Problem Statement

Given a set of *N* independent and identically distributed (iid) samples, *D*, learn the parameters (μ, Σ) of a Gaussian distribution that generated *D*.

MLE approach - maximize log-likelihood

Result

$$\widehat{\mu}_{MLE} = rac{1}{N} \sum_{i=1}^{N} \mathbf{x}_i \triangleq \overline{\mathbf{x}}$$
 $\widehat{\mathbf{\Sigma}}_{MLE} = rac{1}{N} \sum_{i=1}^{N} (\mathbf{x}_i - \overline{\mathbf{x}}) (\mathbf{x}_i - \overline{\mathbf{x}})^{ op}$

. .

< □ ▶		- 《 문 》	E 4) Q ()
CSE 474/574	28 / 31		

Estimating Posterior

 \blacktriangleright We need posterior for both μ and Σ

 $p(\mu)$

$p(\mathbf{\Sigma})$

• What distribution do we need to sample μ ?

A Gaussian distribution!

$$p(\mu) = \mathcal{N}(\mu | \mathbf{m}_0, \mathbf{V}_0)$$

What distribution do we need to sample Σ?

An Inverse-Wishart distribution.

$$p(\mathbf{\Sigma}) = IW(\mathbf{\Sigma}|\mathbf{S},\nu)$$

= $\frac{1}{Z_{IW}}|\mathbf{\Sigma}|^{-(\nu+D+1)/2}exp\left(-\frac{1}{2}tr(\mathbf{S}^{-1}\mathbf{\Sigma}^{-1})\right)$

where,

$$Z_{IW} = |\mathbf{S}|^{-\nu/2} 2^{\nu D/2} \Gamma_D(\nu/2)$$

Chandola@UB

CSE 474/574 29 / 31

イロト 不得 トイヨト イヨト 二日

Posterior for μ - Also a MVN

$$p(\boldsymbol{\mu}|D, \boldsymbol{\Sigma}) = \mathcal{N}(\mathbf{m}_{N}, \mathbf{V}_{N})$$

$$\mathbf{V}_{N}^{-1} = \mathbf{V}_{0}^{-1} + N \boldsymbol{\Sigma}^{-1}$$

$$\mathbf{m}_{N} = \mathbf{V}_{N}(\boldsymbol{\Sigma}^{-1}(N \bar{\mathbf{x}}) + \mathbf{V}_{0}^{-1} \mathbf{m}_{0})$$

Posterior for $\pmb{\Sigma}$ - Also an Inverse Wishart

$$p(\mathbf{\Sigma}|D, \boldsymbol{\mu}) = IW(\mathbf{S}_{N}, \nu_{N})$$
$$\nu_{N} = \nu_{0} + N$$
$$\mathbf{S}_{N}^{-1} = \mathbf{S}_{0} + \mathbf{S}_{\boldsymbol{\mu}}$$
